

## *Spotlight on...* Deep Tissue Laser Therapy

### What is Deep Tissue Laser Therapy?

Laser therapy is a non-invasive technique to help reduce pain and inflammation. Laser therapy can be safely used as an adjunct or replacement for pharmaceutical drugs. This pain relief treatment is FDA cleared and enables patients to have an alternative to drugs and surgery.

### How does it work?

Laser therapy allows your body to utilize it's own healing powers by inducing a series of healing responses in your body. During treatment you will feel a soothing warmth that identifies the beginning of an 18-24 hour process of modulated cellular activity leading to decreased pain and inflammation.

### How many sessions will I need?

Each client's frequency and duration varies based on the nature of the injury. However, most patients see results within 4-6 visits. Also, maintenance treatments can be beneficial for arthritic conditions.

### What are its benefits?

Laser Therapy relieves pain and inflammation associated with:

- Sprains and strains
- Low back pain
- Sports injuries
- Sciatica
- Disc issues
- Tendonosis and tendonitis
- Neck pain
- Shoulder and knee
- Post-surgery healing
